Traffic by direction - 5-minute average

KEY OBSERVATIONS

- Inbound 3.2 TB and outbound 1.1 TB (estimated from sampled flows); average 293.6 Mb/s in and 98.4 Mb/s out.
- Inbound peaked at 760.8 Mb/s at 11:15; outbound peaked at 258.0 Mb/s at 11:40 (5-minute averages, Asia/Riyadh).
- Previous-day comparison is not shown: this day is incomplete (coverage 87%), so it is not comparable with a full day.
- Largest source: 203.0.113.10 with 11.8% of inbound plus outbound volume.
- Data coverage is 87% (250 of 288 five-minute intervals): the volumes above understate real traffic.
- Volumes are estimates: exporters sample 1 in 1000 packets and each record is scaled by its sampling rate.

DATA QUALITY & METHODOLOGY

- Volumes are derived from NetFlow records scaled by the exporter sampling rate: sampled exporters give ESTIMATED traffic, unsampled exporters give observed volume.
- Direction comes from interface boundary metadata (external to internal = inbound). Transit and unclassified flows are not part of inbound or outbound.
- Top-10 shares are relative to inbound plus outbound volume; per-IP and per-service tables use flow records classified as inbound or outbound only.
- Exporters are listed separately and are not added together; a flow seen by two exporters appears in each exporter row.
